

How to measure the battery temperature

Overview

Many studies have shown that high temperatures compromise the performance and lifespan of batteries. In fact, for each 8C rise in temperature, a sealed lead acid battery loses half of its lifespan. And, once the temperature rises, the battery's performance drops. Simply speaking, batteries store energy. They contain chemicals, and the current is what results from the reactions happening between those chemicals. Just like many other chemical reactions. A simple, but outdated way to keep an eye on your battery's temperature is having someone manually checking on the battery string once or twice a week. An IR temperature gun. Downtime caused by battery failures can cause significant financial losses, damage to companies' reputations, and disruption of operations. You know how important it is to keep your network running. Unfortunately, there's no magic crystal ball or something similar to correctly predict battery failure. Yet deploying a battery temperature monitoring system is the next best thing - and that's the way to go.
