

New Energy Battery Nanotechnology

Overview

The Li rechargeable battery is currently the dominant energy storage technology, with much progress made over the past 30 years and bright prospects in the years to come. Nanoscience has opened the door to new possibilities. ••Effects of nanomaterials' morphology on Li rechargeable battery. Increasing awareness of the non-sustainability of fossil fuels, unprecedented pollution levels in urban centers, and increasing global warming have created a sense of urgency. Nanostructure processing has had an incredible impact on the development of new and improved Li rechargeable batteries. The reduced dimensions of nanomaterials (ca. 1-100 nm) have enabled the design and synthesis of a myriad of monodisperse nanomaterials for various applications. The dimensionality of these nanomaterials is 0D, 1D, 2D, or 3D. Nanomaterials have been studied extensively in the past two decades to enhance the performance of Li batteries (Fig. 3). 0D nanomaterials have been widely employed.
