

PV combined with energy storage is the rule

Overview

The integration of photovoltaics and energy storage is the key to a sustainable energy future. In simple words, it is a system that not only produces electricity thanks to solar panels but also stores it in dedicated batteries to be used when the sun is not shining. And it is precisely this ability to "store the sun" that is making storage a valuable ally for those seeking energy. In its latest monthly for pv magazine, the International Solar Energy Society (ISES) explains how pumped-hydro energy storage combined with PV power generation could provide 24/7 power to data centres. Pumped Hydro Energy Storage (PHES) provides a vastly available, highly mature, lowest-cost. Energy storage system integration can reduce electricity costs and provide desirable flexibility and reliability for photovoltaic (PV) systems, decreasing renewable energy fluctuations and technical constraints.
