

Solar power generation grid connection affects voltage

Overview

Renewable energy sources like solar and wind introduce variability and intermittency into power systems, which can affect voltage stability. Fluctuations in power generation may cause voltage levels to rise or fall rapidly, challenging the grid's ability to maintain. A grid-connected PV (photovoltaic) power system is electricity generating solar PV power system that is connected to the utility grid. A grid-connected PV system consists of solar panels, one or several inverters, a power conditioning unit and grid connection equipment. However, with Renewable Distributed Generation (RDG), when connected to a Distribution Network (DN), suffers from power quality issues because of the distorted currents drawn from the loads connected to the network over generation of active power injection at the Point of Common Coupling (PCC). This research. Abstract— The small scale electricity generators such as solar photovoltaic (PV) systems are generally connected to the grid at the primary or secondary distribution and are considered as distributed generation (DG).
